

IMMOLYTE

Contribution to the Poultry Industry

The Power to Resist The *CHOICE* Immunopotentiator

The only Immunopotentiator to improve the immune system, not only in healthy flocks but also in birds with damaged bursa.

Clinical data shows that Immolyte is the clear choice in augmenting cell mediated immunity as well as antibody titres. Immolyte cuts down the incidence of diseases, reduces vaccination failures, improves overall performance and reduces mortality. Immolyte enhances the efficacy of antibiotics and thereby reduces the dosage and treatment period

IMMOLYTE

Today the market exhibits many "immunostimulant" products. Most such products are either mixtures of certain vitamins and minerals or so called herbal products containing "Amla" (Gooseberries). It is true that certain vitamins and minerals like Vitamin E, Vitamin C, Selenium etc., (and hence Amla, containing Vitamin C) can help improve the immunity. But, the magnitude of such an improvement is limited due to the fact that these nutrients are not always deficient and are provided in required quantities in most poultry rations of today. Biologically speaking, giving more of these nutrients will not simply increase the immunity correspondingly.

Fitness of the immune system depends on three important factors viz., Water-electrolyte balance (generally referred to as homeostasis), nutritional fulfillment (especially with respect to Vitamin E, Vitamin C, Se etc.) and immune stimulants (antigens/antigenic associates capable of exciting / arousing the immune system). While most products in the market provide for the first two factors, they generally lack the immune stimulant factor which, in fact, is the most important component of an immunopotentiator meant for poultry use.

Immolyte contains Glycine (an osmolyte) and electrolytes which maintain the water-electrolyte balance and preserve homestasis. Vitamins E and C, and Selenium, contribute to a better cellular health and general immunity. Immolyte also contains unique immune stimulation components like the aminonitrogen (antigenic protein) and specific polysaccharide. Aminonitrogen in Immolyte (antigenic protein) produces non-specific antibodies, and polysaccharides act as a source of lymphokines improving the CMI. Bacterial load on the bird is brought down by the combined effects of Lactoperoxidase system and yeast nucleins. The overall effect of Immolyte, keeps the immune system prepared to react spontaneously and effectively.

Brief Prescribing Information: Contents: Glycine, Vitamin E, Selenium, Vitamin C, Sodium Chloride, Potassium Chloride, Sodium Citrate, Yeast nucleins, Aminonitrogen (Antigenic protein) with Lactoperoxidase and polysaccharides in a fortified base.

Uses: Improves the antibody titers. Reduces vaccination failures. Reduces the incidence of disease through improved CMI. Enhances productivity by reducing the incidence of subclinical infections.

Usage Instructions:

Immolyte Liquid : Chicks, Growers and Broilers : 5 ml per liter. **Layers:** 10 ml per liter,

Immolyte Feed Supplements : 1 kg per ton of feed or as recommended.

Presentation:

Liquid : 100 ml, 500 ml bottle and 5 ltrs Jar

Feed : 1 kg pouch & 5 kg bags

Special Instructions: Use regularly during the first 2 weeks of chick's life. Thereafter, use 3 days before and after vaccinations, deworming or any anticipated stress. Usage during outbreaks and convalescence period is advisable.
