

RESPIRON

INSPIRES RESPIRATION

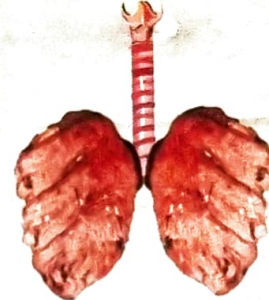

Note : Antibiotic course (5-7 days @ 15-20 paise/bird/day) is both costly and has undesirable effects on feed intake and productivity. Respirom (7 days @ 3-4 paise/bird/day) can improve the response to antibiotic and reduce its course to 3-4 days. This alone can save about Rs. 3000 - 4000 per batch of 10000 birds apart from better productivity.

RESPIRON

INSPIRES RESPIRATION

The respiratory regulatory centers in the brain regulate the amount of carbon dioxide that is exhaled by controlling the speed and depth of breathing. When breathing is increased blood Carbon Dioxide (CO₂) level decreases and blood becomes more basic. When breathing is decreased blood Carbon Dioxide (CO₂) level increases and blood becomes more acidic. By adjusting the speed and depth of breathing the respiratory regulatory centers and lungs are able to regulate the blood pH minute by minute.

An abnormality in this control mechanism of pH can cause one of the major disturbances in acid - base balance. i.e. acidosis or alkalosis. These conditions are not diseases but they are the result of a variety of disorders and disturbances. Metabolic acidosis and metabolic alkalosis are caused by an imbalance in the production and excretion of acids or bases by the kidneys. Respiratory acidosis or alkalosis are primarily caused by lung and breathing disorders. Kidneys also try to compensate by excreting more acid in the urine.

During respiratory distress as in case of CORYZA, CRD, RDC etc. mucus accumulates in alveolar spaces of lungs causing severe discomfort, reduced rate and depth of breathing and reduced rate of gaseous exchange between lungs and the environment. However the genetic makeup will not allow the birds to slow their metabolic rate. High energy diets continue to demand for more oxygen for energy derivation producing Carbon dioxide (CO₂), the excretion of which cannot match the accumulation leading to Respiratory acidosis resulting in greater distress, discomfort, drowsiness, poor resistance, low productivity and poor performance.

CYTOKINE STORM

The cytokine storm is the systemic expression of healthy and vigorous immune system resulting in the release of more than 150 inflammatory mediators (cytokine, oxygen free radicals and coagulatory factors). The cytokine storm is an exaggerated immune response that is caused by rapidly proliferating and highly activated T cells and Natural Killer (NK) cells which are activated by infected macrophages. This cytokine storm should be suppressed.

During respiratory infection the cytokine storm affects lungs damaging alveoli and lung tissue resulting in more mortality. Pulmonary surfactant is a unique mixture of lipids and surfactant specific proteins that cover the entire alveolar surface of lungs (air sacs). Pulmonary surfactants reduce the surface tension at the air-liquid interface throughout lungs forming a layer between the air and liquid interface.

Respiron modifies the bio physical behaviour of the lungs. The immuno potentiating properties make Respiron a fascinating compound in adaptive immunity of the lungs. The surfactant in Respiron acts as a first line defense against invading organisms. Respiron improves bronchial clearance by its mucolytic action.

CONTENTS:

Alkalizers, Urinary Acidifiers, buffers and Amino nitrogen in fortified base.

FEED PREMIX: 1kg x 25 Drum

25Pkts per drum.

500 gms - 1 kg per ton of feed or as recommended.

USAGE INSTRUCTIONS:

During Respiratory Distress 1 ml. per liter of water for 4 days with prescribed antibiotic. Continue Respiron for 3 days after withdrawing antibiotic for better results. In susceptible flocks as a precautionary measure 0.5-1 ml. per liter of water. Or as recommended by the Veterinarian.

PACKING:

1 Ltr., 5 Ltr. & 30 Ltrs.

Differentiates the Difference
