

VESMIN FORTE

FEED PREMIX

**Chelated Trace Minerals with Probiotics
and Saccharomyces Yeast**

VESMIN FORTE

VESMIN FORTE is a Chelated Trace Mineral Premix for poultry containing optimum levels of all the essential trace minerals in the form Mineral Proteionates to ensue superior bioavailability of the minerals required for normal functioning as well as to be healthy and to maintain high standards of production. Chelated Trace Minerals are organic forms of essential minerals such as Manganese, Zinc, Copper, Cobalt, Iron, Iodine, Chromium and Selenium. Birds digest, absorb and assimilate the organic mineral chelates better than the inorganic minerals.

Different minerals have different levels of bioavailability. Before a trace mineral is absorbed, it must become attached to an organic molecule or 'Escort'. This process allows the minerals to pass through the intestine into the blood stream and on to tissues and organs for utilization.

Chelated Trace Minerals have been developed by binding the minerals to proteinates to increase their bioavailability. The pathway of normal trace minerals absorption is different from proteinated trace minerals. Hence there is no competition for use of the same uptake mechanism. The bioavailability of Proteinated Trace Minerals is much higher, they are easily transported and the intestinal absorption is increased by about 50%.

COMPOSITIONS:-

Each kg contains:- Manganese 80 gm, Zinc 80 gm, Copper 15 gm, Cobalt 0.5 gm, Iron 60 gm, Iodine 1 gm, Chromium 12.5 mg, Selenium 0.3 gm, Lactobacillus 1.5 million spores, Saccharomyces Cerevisiae 10×10^{11} CFU, Amino Nitrogen q.s. in fortified base.

ADVANTAGES:-

Chelated Trace Minerals (CTM) are readily soluble in the intestinal contents enabling the product to be homogeneously distributed in the intestinal contents and to be able to reach the surface of the intestinal tract for better absorption. The CTM is more stable in the intestinal tract. It protects the minerals from antagonists present in the diet and also from the gut pH as it passes through the digestive tract. The CTM is absorbed more readily than the inorganic form of the mineral. The CTM improves metabolic utilization of the trace minerals by reducing the interaction, protecting from sequestration in cells and binding with dietary and physiological constituents.

INDICATIONS:-

Replaces the inorganic trace minerals in feed. Chelated Trace Minerals are more stable and are protected from adverse reactions of other nutrients which could reduce their rate of absorption. Prevents competition for absorption among minerals. Chelated Trace Minerals are instant mineral source during stress and deficiency. Better health, production and reproduction. Reduces the incidences of leg weakness and broken eggs.

USAGE INSTRUCTIONS:-

750 gm to 1 kg per ton of feed.
or as recommended by the Veterinarian.

PRESENTATION:-

20 kg bag.
