

Zymolact Option 1*

Savings in feed input

Use Zymolact in your diet regularly and from around 15th day onwards save 3-10 gm/adult layer/day, Or 100-150gms/broiler/6wk.

Zymolact

NEW GENERATION PERFORMANCE ENHANCER

Use it as you like !!!

Because of its versatility, Zymolact can be used in different ways for better profitability. Again, unlike other performance promoters which do not have a wider range of application utility, Zymolact offers itself for 4 most purposeful objectives, as depicted here.

Zymolact Option 3*

Savings in DLM/Choline

Use Zymolact in your diet; save as much methionine and/or choline as possible, with better results.

Zymolact Option 2*

Savings in feed cost

Use Zymolact in your diet to make use of low-cost feed ingredients or cope with low dietary protein profile.

Zymolact Option 4*

Savings in Liver Tonics

Use Zymolact in your diet to reduce the expenditure on liver tonics and/or liver stimulants.

Choose the one suitable to you. Or else request your veterinarian to plan out which program is the best for you. You can even write to us with details of your feed and we will pick out the best program and guide you accordingly.

** It is advisable to alter the feed formulation in consultation with a nutritionist or veterinarian only.*

Zymolact

NEW GENERATION PERFORMANCE ENHANCER

WHAT MAKES ZYMOLACT SUPERIOR?

Zymolact has been developed through extensive research with non-uniformity of batchmate birds and limitations of various performance promoters in mind. Zymolact is the result of integration of the working principles of different performance promoters with further improvement. Unique Gut Stabilization Factors (GSF), Lumen Trophic Factors (LTF) and Zymogen Inducers (ZI) in Zymolact maximize the expression and activation of native gut enzymes to tackle the food substrates for better degradability. The concurrent profile of exogenous enzymes is complementary to the host enzymes to improve digestion and to reduce the adverse effects of antinutritional factors which are invariably present in the diet. The GSF and LTF act synergistically to bring in the best gut microenvironment in terms of largest absorptive surface and optimum pH, thereby maximizing the absorption of all the digested nutrients. Further, derivatives of LTF which boost up the natural somatotrophic hormone activity would improve the retention and utilization of nutrients. By virtue of these concurrent and synergistic reactions, a superior overall performance and FCR is bound to occur.

In addition, Zymolact has many other plus points such as presence of (a) probiotic cultures which keeps infections at bay and contributes to better productivity, (b) methyl donors which have a sparing effect on methionine and/or choline chloride, and (c) lipotropic effect which imparts a better liver health and performance.

Zymolact is currently the one and the only performance enhancer, which because of its versatility can provide you the option of using it as per your convenience. For advice on how to make the best out of Zymolact for your poultry operations, please contact your veterinarian or write to us.

Brief Technical Information: Zymolact Contents: Probiotics (Bacillus Spp., Lactic Acid Bacillus, Saccharomyces Yeast), Enzymes (Amylase, Protease, Cellulase, -galactosidase, Lipase, Phytase) with Gut Stabilizers, Lumen Trophic Factors, Zymogen Inducers, Methyl Donors and Amino Nitrogen (Stress Proteins derived from various sources) in a fortified base. **Uses:** To improve, maintain and enhance the efficiency of gut for digestion, absorption and assimilation of nutrients. Improves production and FCR even during stress. **Usage Instructions:** 500g-1 Kg per ton of feed regularly, or as directed by the Veterinarian. **Availability:** 5 & 20Kg bags.

Vesper Pharmaceuticals

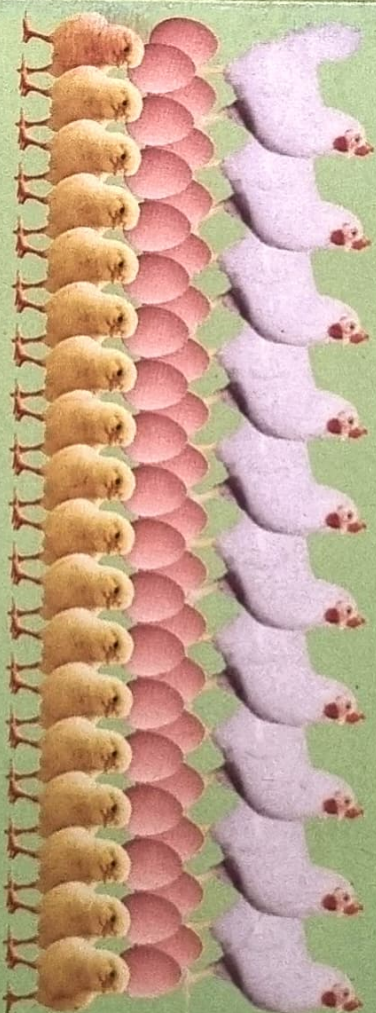

Village Singapura,

Vidyanarayana Post,

Bangalore - 560 097.

Zymolact

NEW GENERATION PERFORMANCE ENHANCER

For best flock uniformity and maximized returns

Batch uniformity is a factor seriously affecting the economics in broilers and layers as well. In any given batch, about $\frac{1}{3}^{\text{rd}}$ of the birds grow and produce at below optimum levels. It is observed that such birds perform at about 10-20% (around 10% in growers/layers; 15-20% in broilers) lesser than their normal batchmates, thereby pulling down the performance average of the entire batch by about 2-4%.

Due to their poor nutrient utilization ability, such unthrifty birds will, in fact, be consuming relatively more feed than the normal ones. Thus in all probability, though you are feeding the entire batch a good quantity of a good quality feed, you still may not be receiving the actual returns. Further, at the very instance of any stress (nutritional, managerial, pathological or any other) these birds are the first to be affected and the last to recover, with the highest contribution to production losses. But, given the right support, these birds can definitely perform as well as the normal birds.

All the performance promoters available today, which exist singly or in combinations, appear to mitigate only any one aspect of this unwanted scenario. Feed antibiotics and/or probiotics mainly reduce gut (pathogenic) bacterial loads. Enzyme supplements primarily aim at improving the feed digestibility. Phospholipids may improve the nutrient uptake. But, until and unless the gut is stabilized and optimized, and the nutrient retention capacity of the bird is enhanced, these effects may not prove to be all that beneficial.

Zymolact offers you an all-round improvement
